

## Mobile Application a First for Hospital Transportation Management

*TransportTracking mobile™ Unlocks the Chains that Bind*

TeleTracking Technologies is announcing the launch of their newest mobile version of its hospital transport management software called **TransportTracking mobile™**. The healthcare industry's first dispatcher-less transport management solution, **TransportTracking™** has been helping hundreds of hospitals expedite and measure hospital transport teams for more than a decade and at the **2007 ASHES / NAHTM** Conference in St. Louis, MO on October 1<sup>st</sup>, TeleTracking will be showcasing this new mobile version.

This wireless, hand-held device will allow supervisors to be on the floors and in hallways where their transporter team is working. They'll be able to manage and modify workload with a few clicks rather than running back to their desks. Plus, they have real-time access to report data and statistics to help improve the efficiency of their team. This means greater satisfaction for the areas they serve such as patients, clinical staff and hospital operations. Transport staff will also use the mobile version to wirelessly receive and manage all information about their transport tasks making them more efficient and productive.

**TransportTracking mobile™** is a recent enhancement allowed by the recent launch of TeleTracking's new technology platform called TeleTracking XT™; this browser-based software provides flexibility, scalability and a new and easy to navigate user interface for hospitals.

**TransportTracking™** powered by TeleTracking XT and **TransportTracking mobile™** will be on display at the **ASHES/NAHTM** conference being held in St Louis, MO from September 30-October 4, 2007. Stop by Booth # 407 to see all of their capacity and patient flow management products in action.

### About TeleTracking Technologies

TeleTracking Technologies is the world leader and innovator in patient flow automation, serving over 680 hospitals in the US, Canada and the United Kingdom. They provide a wide array of software products and services designed to deliver real-time control over the patient flow process, which is acknowledged as the No. 1 cause of hospital overcrowding worldwide.
